C.Comment: This enzyme plays a role in the mitochondrial beta-oxidation of short chain f
C.Comment: This enzyme plays a role in the mitochondrial beta-oxidation of short chain f
C.Superfamily: 3-hydroxyacyl-CoA dehydrogenase; 3-hydroxyacyl-CoA dehydrogenase homology
C.Keywords: fatty acid beta-oxidation; homodimer; mitochondrion; NAD; oxidoreductase
F1-12/Domain: transit peptide (mitochondrion) #status predicted <TPP>
F13-314/Product: 3-hydroxyacyl-CoA dehydrogenase, short chain-specific #status predicte
F;27-314/Domain: 3-hydroxyacyl-CoA dehydrogenase homology <ACD>
F;29-57/Region: beta-alpha-beta NAD nucleotide-binding fold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3-hydroxyacy1-CoA dehydrogenase (EC 1.1.1.35), short chain-specific, precursor - mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NyAlternate names: RAE-38 protein

Genome Biol. 3:RESEARCH0083.1-RESEARCH0083.22(2002).
-!- FUNCTION: Fkh promotes terminal as opposed to segmental
- ethorograment. In the absence of £kh, this developmental switch does not occur. The nuclear localization of the £kh protein suggest that £kh regulates the transcription of other, subordinate, genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=22426069; PubMed=12537572;

Heapes in developing central nervous system (CNS). Essential for many, if not all, late developing neuroblastcoma (NB) sublineages.

Ends to the 5'-(GG[C[CT][CT]AAAAA[AT]-3' DNA sequence, like hb, suggesting that cas and ha act as a late regulators in early and late CNS NB sublineage, respectively. Acts by repressing expression of nub/pdm-1 and pdm2/pdm-2 POU genes, and restrict this pattern of expression in appropriate cells. Required for a full expression of vvl/drifter and acj6/1-POU; it is however unknown whether it directly activates these genes. Controls unknown whether it directly activates these denes. Controls

Hospital (en) expression in the ventral nerve chord.

Hospital SpECIFICITY: Expressed in a specific subset of neuroblasts in the ventral nerve chord and the procephalic region in the embryo. Expressed in many, if not all, late delaminating NBs, and in early NBs, but only after they have undergone several rounds of marily NBs, but only after they have undergone several rounds of sugalion mother cell-producing divisions.

Hospital SpECIFICITY: Expressed in embryos. Expressed from blarcoerm embryos. Not expressed in first and second instar larvae. May be weakly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

"The Drosophila castor gene is involved in postembryonic brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- SIMILARITY: Contains 1 A.T hook DNA-binding domain.
-!- SIMILARITY: Contains 4 C2H2-type zinc fingers.
-!- CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 782.

Composition useful for producing fibers or films, comprises hybrid multiblock copolymer derived from Nephila clavipes or Bombyx mori silks.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a novel composition (C1) comprising a hybrid multiblock copolymer. The multiblock copolymer comprise peptide linkers, which are derived from peptide sequences found in native silk biomacromolecules or the crystalline domains of Nephila clavipes or Bombyx mori silks. The present sequence is one such peptide linker. (C1 is useful for producing films or fibers utilized in tissue-engaineering scaffolds, cell culture substrates, biocompatible coatings, sutures, membranes, grafts and drug delivery systems. (C1) enables to produce fibers or films having increased stiffness and tensile strength.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cell attachment; cell culture; transplantation; vaccine; antibiotic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with cacids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The collypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits material, relative to conventional methods. The polypeptide also exhibits heart stability, thus sterilization in autoclaves can be performed this heat stability, thus sterilization in autoclaves can be performed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                             The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, bormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation of cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits has tability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related
                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composition comprising a substance that modulates the structure of proteins and polynuclectides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                         The present invention relates to a novel composition (CI) comprising a hybrid multiblock copolymer. The multiblock copolymer comprise peptide linkers, which are derived from peptide sequences found in native silk biomacromolecules or the crystalline domains of Nephila clavipes or Bombyx mori silks. The present sequence is one such peptide linker. (CI is useful for producing films or fibers utilized in tissue-engineering scaffolds, cell culture substrates, biocompatible coatings, sutures, membranes, grafts and drug delivery systems. (CI) enables to produce fibers or films having increased stiffness and tensile strength.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel human cancer-related genes and proteins (AB278120-AB278168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                       New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 44; DB 6; Length 15; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention relates to novel human cancer-related genes and proteins are useful ABZ78150-ABZ01861. The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                    New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic multiblock copolymer; linker; peptide block; native silk biomacromolecule; crystalline domain; structural biopolymer; silk; beta-sheet forming crystalline segment; film; fibre; high tensile strength; spider; beta-sheet crystalline segment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Spider beta-sheet crystalline segment found in silk biopolymer.
